Your Drinking Water Report

2008

MWRA BOARD OF DIRECTORS

IAN A. BOWLES, CHAIRMAN
JOHN J. CARROLL, VICE-CHAIR
JOSEPH A. MACRITCHIE, SECRETARY
JOEL A. BARRERA
KEVIN L. COTTER
JOSEPH C. FOTI
MICHAEL S. GOVE
JAMES W. HUNT, III
VINCENT G. MANNERING
ANDREW M. PAPPASTERGION
MARIE T. TURNER

Dear Customer,

The Massachusetts Water Resources Authority is pleased to send you this year's annual report on your drinking water quality. MWRA and your local water department test thousands of water samples each week, under strict federal and state guidelines. The results for 2008 are excellent: for the 120 contaminants we test for, every standard was met.

I am also pleased to report that the lead test results for 2008 and the first half of 2009 show that system-wide, MWRA was below the federal Lead Action Level. It is important to remember that lead is not in the source water, but can enter the water through some household plumbing that contains lead. Recent tests have also shown that there are no traces of pharmaceuticals in MWRA water.

Your tap water is one of the best values around. For less than a penny a gallon, you receive some of the cleanest, best tasting drinking water in the country. That penny also provides you with experienced, professional staff who protect, treat and deliver your water and make sure it is always available.

MWRA has great confidence in the water we deliver to your home, and we want you to have the same confidence. This report contains important information, and I hope you take a moment to read through it. Please contact us if you have any questions or comments about your water quality, or any of MWRA's programs.

Sincerely,

Frederick A. Laskey
MWRA Executive Director

This report is required under the Federal Safe Drinking Water Act and provides information on:

Where your water comes from _____	2
Map of the water system _____	2
How your water is treated _____	3
Improvements to the system _____	3
Test results _____	4
Information about lead _____	5
Special notice for the immuno-compromised _____	6
List of further resources _____	6

WHERE DOES YOUR WATER COME FROM?

WATERSHED PROTECTION:

The pristine watersheds enhance the value of the water by keeping potential pollutants out and making treatment easier.

Your water comes from the Quabbin Reservoir, about 65 miles west of Boston, and the Wachusett Reservoir, about 35 miles west of Boston. These reservoirs supply wholesale water to local water departments in 50 communities, 44 in greater Boston and MetroWest, three in western Massachusetts, and serves as a back-up supply for three others. The two reservoirs combined supplied about 206 million gallons a day of high quality water to consumers in 2008.

Quabbin and Wachusett watersheds are protected naturally with over 85% of the watersheds covered in forest and wetlands. About 75% of the total watershed land cannot be built on. The natural undeveloped watersheds help to keep MWRA water clean and clear. Also, to ensure safety, the streams and the reservoirs are tested often and patrolled daily by the Department of Conservation and Recreation (DCR).

Rain and snow falling on the watersheds - protected land around the reservoirs - turn into streams that flow to the reservoirs. This water comes in contact with soil, rock, plants, and other material as it follows its natural path to the reservoirs. While this process helps to clean the water, it can also dissolve and carry very small amounts of material into the reservoir. Minerals from soil and rock do not typically cause problems in the water. But, water can also transport contaminants from human and animal activity. These can include bacteria, viruses, and fertilizers - some of which can cause illness. The test data in this report show that these contaminants are not a problem in your reservoirs' watersheds.

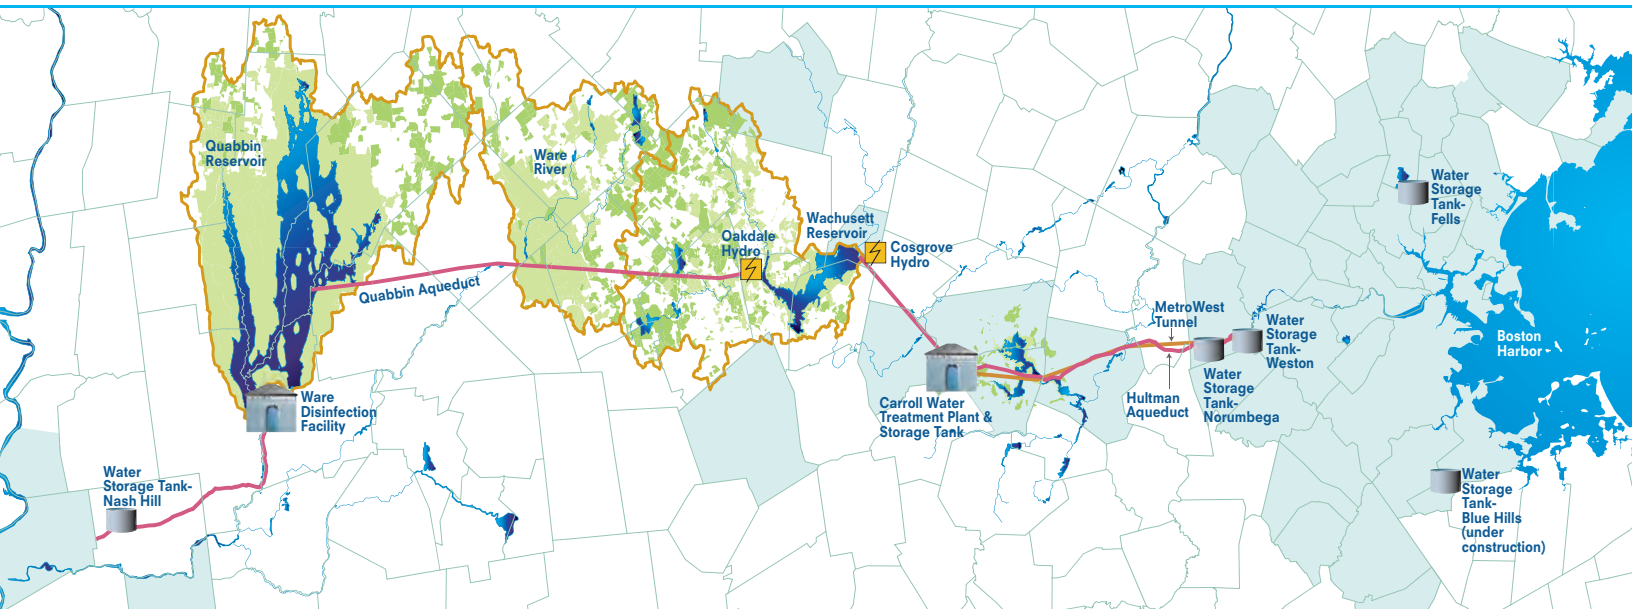

The Department of Environmental Protection (DEP) has prepared a Source Water Assessment Program report for the Quabbin and Wachusett Reservoirs. The DEP report commends DCR and MWRA on the existing source protection plans, and states that our "watershed protection programs are very successful and greatly reduce the actual risk of contamination." The report recommends that we maintain present watershed plans and continue to work with the residents, farmers, and other interested parties to maintain the pristine watershed areas.

TAP WATER – THE GREEN CHOICE!

As water travels eastward through tunnels from the Quabbin and Wachusett Reservoirs, clean hydro-electric energy is produced. The electricity generated is used to reduce MWRA's energy demands. Also, the clean, fresh water is delivered straight to your home without the fuel consumption of trucking or the waste left behind by plastic bottles.

FROM THE RESERVOIR TO YOUR HOME

BOTTLE VS. TAP – THE SMART CHOICE

Even though tap and bottled water must meet the same standards, bottled water costs hundreds of times more - a penny for tap compared to \$1 to \$8 a gallon for bottled. Tap water must meet more intensive Environmental Protection Agency (EPA) testing requirements than bottled water, which is regulated by the Food and Drug Administration (FDA).

WATER TREATMENT STEPS

The water you drink is treated at the John J. Carroll Water Treatment Plant in Marlborough. The first treatment step is disinfection of reservoir water. MWRA's licensed treatment operators carefully add measured doses of ozone gas bubbles to the water to kill any pathogens (germs) that may be present in the water. Fluoride is then added to reduce cavities. Next, the water chemistry is adjusted to reduce corrosion of lead and copper from home plumbing (see page 5). Last, we add mono-chloramine, a mild and long-lasting disinfectant combining chlorine and ammonia, which protects the water while it is in the local pipelines.

At the treatment plant control center, MWRA staff can control water treatment from Quabbin Reservoir to Norumbega Storage Tank in Weston to ensure properly treated water at all times of the day and night.

WHAT IS OZONE?

Ozone consists of three atoms of oxygen. It is created by applying an electrical current to pure oxygen in a specially designed chamber. Ozone provides better disinfection than chlorine alone, especially against *Cryptosporidium* and other hard to kill germs. It also reduces the amount of potentially harmful chlorine byproducts.

IMPROVEMENTS TO THE WATER SYSTEM

Over the last ten years, in addition to the treatment plant, MWRA has improved watershed protection, built the MetroWest tunnel, installed covered storage tanks, and rehabbed many miles of pipeline. These projects are the largest investments since the construction of the Quabbin Reservoir in the 1930s.

MWRA and its partner communities will continue to make necessary improvements to ensure high quality water is delivered directly to the customer's tap. One high priority is rehabbing older pipes within the extensive pipe network. MWRA is upgrading its own pipes, as well as providing zero-interest loans to help communities improve their older pipes. To save money and limit traffic and service disruptions, construction crews try to clean and reline rather than replace pipes whenever possible.

WATER CONSERVATION

On average, each person uses about 65 gallons of water each day. There are many simple ways you can conserve water and lower your bills, including: fixing leaks, installing low-flush toilets and low-flow shower heads, or minimizing your outdoor watering. MWRA has an active conservation program, and it is paying off. Demand has dropped dramatically and water usage is lower than it has been in over 40 years. Still, there is more work to be done to conserve this precious resource. To find out more, contact the MWRA at 617-242-SAVE or visit www.mwra.com.

The Blue Hills covered storage tanks are nearing completion and expected to go on-line in Fall 2009.

TESTING YOUR WATER EVERY STEP OF THE WAY

Our professional lab staff has many years of experience and performs thousands of tests each week to make sure the water supplied meets all the federal and state standards.

TESTS BEFORE TREATMENT

We test the water as it leaves the reservoir to see how well protected our watersheds are. Test results show few contaminants are found in the reservoir. The few that are found are in very small amounts, well below EPA's standards. Turbidity (or cloudiness of water) is one measure of overall water quality. Typical levels at the Wachusett Reservoir are 0.3 NTU (Nephelometric Turbidity Units). In 2008, turbidity was always below EPA's standard of 5.0 NTU. It was also below the stricter Massachusetts standard of 1.0 NTU over 99.99% of this time, with the highest level at 1.17 NTU. This did not interfere with effective disinfection. MWRA also tests reservoir water for pathogens – such as fecal coliform, bacteria, viruses, *Cryptosporidium*, and *Giardia*. They can enter the water from animal or human waste. All test results were well within state and federal testing and treatment standards.

TESTS IN COMMUNITY PIPES

MWRA and local water departments test 300 to 500 water samples each week for total coliform bacteria. Total coliform bacteria can come from the intestines of warm-blooded animals, or can be found in soil, plants, or other places. Most of the time, these bacteria are not harmful. However, their presence could signal that harmful bacteria from fecal waste may be there as well. The EPA requires that no more than 5% of the samples in a month may be positive for total coliform. If a water sample tests positive for total coliform, we run more specific tests for *E.coli*. *E.coli* is a bacteria found in human and animal fecal waste and may cause illness.

TESTS AFTER TREATMENT

EPA and state regulations also require many water quality tests after treatment to check the water you are drinking. MWRA follows – and even goes beyond – these tests. We conduct tens of thousands of tests per year on over 120 contaminants. For a complete list of what we test for, go to www.mwra.com.

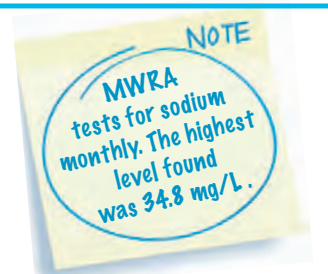

The only contaminants detected are listed below, and all met EPA's standards. The bottom line is that the water quality is excellent.

TOTAL COLIFORM RESULTS

Community	Highest % of positive samples and month	Violation of EPA's 5% limit
Framingham	1.3% (June)	No
Waltham	1.3 (April)	No
MWRA Transmission Line	0.3% (August)	No

How did we do in 2008? The table above reports test results from 30 communities that receive all of their water from MWRA. Total coliforms were found in two communities, though no community exceeded the EPA standard. For more information, please read your community letter.

4

This is about 9 mg per 8 oz. glass which would be considered Very Low Sodium by the Food and Drug Administration (FDA).

Test Results - After Treatment

Compound	Units	(MCL) Highest Level Allowed	(We found) Detected Level-Average	Range of Detections	(MCLG) Ideal Goal	Violation	How it gets in the water
BARIUM	ppm	2	0.009	0.008-0.011	2	No	Common mineral in nature
MONO-CHLORAMINE	ppm	4-MRDL	2.0	0.0-3.9	4-MRDLG	No	Water disinfectant
FLUORIDE	ppm	4	1.04	0.55-1.22	4	No	Additive for dental health
NITRATE^	ppm	10	0.16	0.02-0.16	10	No	Atmospheric deposition
NITRITE^	ppm	1	0.007	0.005-0.007	1	No	Byproduct of water disinfection
TOTAL TRIHALOMETHANES	ppb	80	3.7	0.7-7.5	ns	No	Byproducts of water disinfection
HALOACETIC ACIDS-5	ppb	60	5.7	nd-10.5	ns	No	Byproducts of water disinfection

KEY: **MCL**=Maximum Contaminant Level - The highest level of a contaminant allowed in water. MCLs are set as close to the MCLGs as feasible using the best available technology. **MCLG**=Maximum Contaminant Level Goal - The level of contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety. **MRDL**=Maximum Residual Disinfectant Level. The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants. **MRDLG**=Maximum Residual Disinfectant Level Goal. The level of a drinking water disinfectant below which there is no known or expected health risk. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contamination. **ppm**=parts per million **ppb**=parts per billion **nd**=not detected **ns**=no standard ^As required by DEP, the maximum result is reported for nitrate and nitrite, not the average.

WHAT TO KNOW ABOUT LEAD IN TAP WATER

WHAT CAN I DO TO REDUCE EXPOSURE TO LEAD IN DRINKING WATER?

Run the tap until after the water feels cold. To save water, fill a pitcher with fresh water and place in the refrigerator for future use.

Never use hot water from the faucet for drinking or cooking – especially when making baby formula or other foods for infants.

Ask your local water department if there are lead service pipes leading to your home.

Test your tap water. Contact MWRA (617-242-5323, www.mwra.com) for more tips and a list of certified labs.

Be careful of places you may find lead in or near your home. Paint, soil, dust, and some pottery may contain lead.

Call the Department of Public Health at 1-800-532-9571 or EPA at 1-800-424-LEAD for health information.

MWRA water is lead-free when it leaves the reservoirs. MWRA and local pipes that carry the water to your community are made mostly of iron and steel, and do not add lead to water. However, lead can get into tap water through pipes in your home, your lead service line, lead solder used in plumbing, and some brass fixtures. Corrosion or wearing away of lead-based materials can add lead to tap water, especially if water sits for a long time in the pipes before it is used.

WHAT IS MWRA DOING TO LOWER LEAD LEVELS? WHAT CAN I DO?

In 1996, MWRA began adding sodium carbonate and carbon dioxide to adjust the water's pH and buffering capacity. This change has made the water less corrosive, thereby reducing the leaching of lead into drinking water. Lead levels found in sample tests of tap water have dropped by over 80 percent since this treatment change. Local water departments are working to

decrease lead corrosion by replacing existing lead service lines. Also, MWRA is working with city and state governments to get rid of lead in all new household plumbing, in particular faucets. Federal law still allows new faucets to contain as much as 8% lead.

To further decrease your potential exposure, you should always use cold, fresh running water for drinking or cooking and buy plumbing fixtures that have no or low lead levels. Read the labels of any new plumbing fixture closely.

MWRA MEETS LEAD STANDARD IN 2008

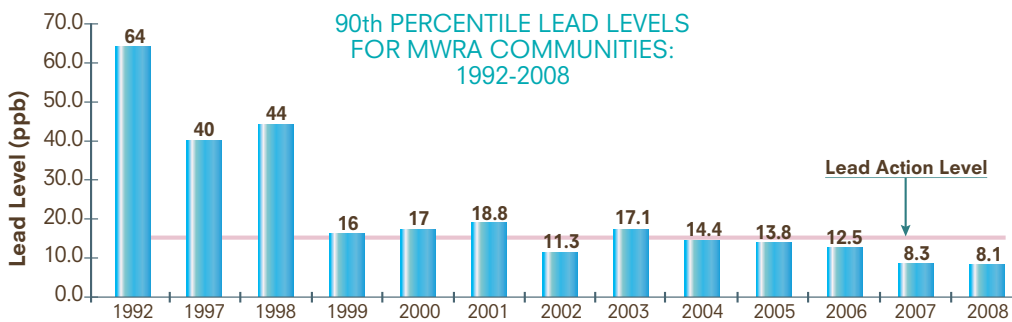

Under EPA rules, each year MWRA and your local water department must test tap water in a sample of homes that are likely to have high lead levels. These are usually homes with lead service lines or lead solder. The EPA rule requires that 9 out of 10, or 90%, of the sampled homes must have lead levels below the Action Level of 15 parts per billion (ppb).

Lead levels in sampled worst case homes have dramatically dropped since 1992. Over the last several years, the results have been below the EPA standard, including the last 10 sampling rounds. Results for September 2008 are shown in the table. 9 of 10 houses were below 8.1 ppb, which is below the Action Level of 15 ppb. Some communities had more than one home test above the Action Level. If you live in one of these communities, your town letter on page 7 will provide you with more information.

SEPTEMBER 2008 LEAD & COPPER RESULTS

	Range	90% Value	(Target) Action Level	(Ideal Goal) MCLG	# Homes Above AL/ # Homes Tested
Lead	1.2-39.9 ppb	8.1 ppb	15 ppb	0	12/450
Copper	0.003-0.44 ppm	0.11 ppm	1.3 ppm	0	0/450

AL=Action Level – The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow. Definition for MCLG available on page 4.

IMPORTANT INFORMATION FROM EPA ABOUT LEAD

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. MWRA is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. If your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at 1-800-426-4791 or www.epa.gov/safewater/lead.

IMPORTANT EPA & DEP INFORMATION

ARE THERE DRUGS IN MY DRINKING WATER?

Recently, you may have heard news reports about pharmaceuticals found in drinking water supplies in some parts of the country. Test results have shown no traces of drugs in MWRA's water supply. Pharmaceuticals in drinking water are more of a concern with water supplies that have wastewater discharged into them, but since MWRA's water sources are well protected, this is not a concern.

CONTAMINANTS IN BOTTLED WATER AND TAP WATER

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (1-800-426-4791) or MWRA.

In order to ensure that tap water is safe to drink, the Massachusetts DEP and EPA prescribe regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) and the Massachusetts Department of Public Health regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

ONGOING RESEARCH FOR NEW REGULATIONS

Test	Measurement Units	2008 Average
Cryptosporidium	oocysts per 100L	0.009 [^]
Giardia	cysts per 100L	0.115
NDMA	ng/L	1.8*

KEY: ng/L=nanograms per liter (parts per trillion)
[^]Proposed treatment threshold is 1 oocyst per 100 liters.
 *The DEP "guidance value" is 10 ng/L

RESEARCH AND REGULATIONS

MWRA has been working with EPA and other researchers to define new national drinking water standards by testing for contaminants that are not regulated. Our

results will be used with those of other water suppliers to help EPA set regulations if they are necessary. In order to better understand the water supply and treated water, MWRA has voluntarily been testing for *Cryptosporidium* and *Giardia*.

DRINKING WATER AND PEOPLE WITH WEAKENED IMMUNE SYSTEMS

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk for infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Town of Lexington Water & Sewer Division

This Drinking Water Report is intended to provide information to Lexington residents about their water supply. Our Town works in partnership with the Massachusetts Water Resources Authority (MWRA) to deliver quality drinking water to each customer for consumption, fire protection and other uses. Helping residents learn more about water quality and the effort that goes into maintaining the system is part of this partnership. By providing this information we also hope to encourage conservation and protection of this precious resource.

Our water comes from the Quabbin Reservoir in Western Massachusetts, through the Wachusett Reservoir, and is transported in tunnels and pipes through the new Carroll Water Treatment Plant to four metered locations that supply the Town of Lexington. There are 158 miles of water distribution pipes in Lexington that on average deliver approximately 5 million gallons per day (MGD) to our customers. Demand for water fluctuates seasonally, with higher volumes during the summer months. Lexington has an irrigation meter policy where a second meter can be installed for lawn watering or other types of irrigation uses.

The most frequently asked question that we receive about water quality concerns the potential presence of lead in tap water. The answer is simple: the water we supply to your home does not contain any lead. If any lead is present at the tap, it has been picked up through contact with brass fixtures (which contain lead in the alloy) or with lead elsewhere on the premises, such as lead solder used in plumbing work. Lead water services (the pipe connection running from the house foundation to the water main in the street) may also be a factor. However, lead has not been used for water services or in household pipes since before World War II. Although the majority of homes dating from this earlier era either never used lead or have since had their water services replaced, there are still a small number of lead services in place. Also, note that lead can still be found in many brand new brass fixtures.

Lexington has an ongoing "lead service replacement program" that was established when the Town had more than one home test above the Lead Action Level. Lexington has successfully passed the last seven lead sampling collections, with the September 2008 lead result of 5.38 ppb compared to the Action Level of 15 ppb. Lexington is no longer mandated by the DEP to maintain the lead service line replacement program but will continue to administer the program until all potential lead locations have been investigated and removed. To find out if you might have a lead service line and how it can be replaced, please contact the Water/Sewer Department at the number listed below

The employees of the Water and Sewer Division give considerable effort to providing a high level of service to our customers. On a daily basis we respond to customer inquiries about billing, water pressures or flow issues, meter installations and water quality to name a few. There are programs in place to maintain the valves (3500 in the system to control the flow of water in Town) the hydrants (1500+), which are flushed on an annual basis, and are in the process of being reconditioned and painted. Along with the Engineering Department we are identifying and replacing the aging infrastructure of both the water and sewer systems. Emergency response by the Division is rapid to minimize service interruptions, for example, from water breaks or leaks or low-pressure problems. The Division also displays water conservation materials during Discovery Day and again during Water Conservation Week. Pamphlets relating to water conservation are available at the Tax Collector's Office in Town Hall and the Public Works Operations Facility at 201 Bedford Street.

If you have any questions please call the Water and Sewer Division. Thank You,

Dennis Meehan
